How do I access WebDAV on iPhone/iPod Touch

The step-by-step below will demonstrate how to connect to your NAS via WebDAV on iPhone/iPod Touch
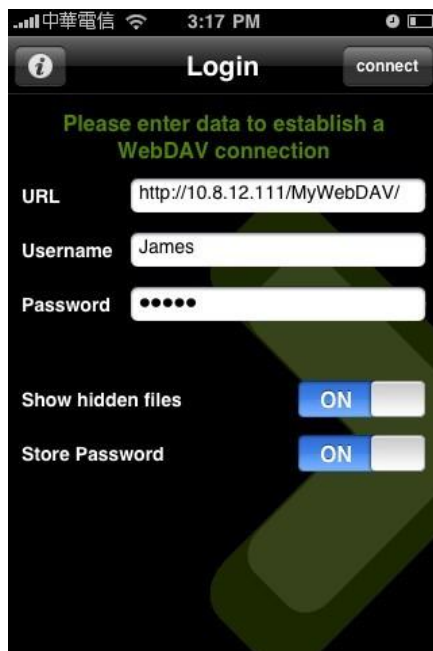

iPhone Firmware Version: 3.1.2
QNAP NAS Firmware Version: 3.2.0

Before getting started

You will need an app which supports WebDAV client. Open "App Store" app on your iPhone, and search for "webdav", you will find there are several apps which support WebDAV client.

We will use one of the free apps - "DAV-E free" in the following demonstration.

1. After app has been installed successfully, launch the app on your iPhone

2. Enter the URL of your WebDAV host, username and its password.
    Example: http://IP_or_Host/Share_Name

3. There you go! After successfully login to the server, you not only can browse all the folders and files in this share folder, but also can access/open the files (if the format is supported by OS X on iPhone/iPod Touch).
